

Why EMF Meters do not change their numbers when Blushield is installed

Everything electrical, electronic and wireless emits electromagnetic radiation. These electromagnetic fields are called EMF and EMR.

EMF is non-ionising radiation (NIR) human-made artificial electromagnetic fields, radio waves, microwaves, millimetre waves, 5G etc.

There are many different types of EMF/EMR including:

Magnetic Fields, Electric Fields, Ground Current, Contact Current, Body Voltage, High-Voltage Frequency Transients ('dirty electricity') and Radio Frequency/Microwave Radiation.

EMF meters, including Gaussmeters, a GS Meter and RW/MW meters etc., are programmed to ONLY show numbers, colours and noises for the electromagnetic field.

The Other EMF Culprit

There is another field inherent in all EMF. This is the not well understood 'Information Field' - also called the Scalar component - and this is very much a concern as it is even more *bioactive*. EMF meters ARE NOT programmed to show this.

EMF protection such as EMF clothing, stickers, buttons, paints, shielding curtains, canopies and even a Faraday Cage are 'passive'. That is, they are not powered. They are unable to protect from the powered Information Field which is highly bioactive.

All EMF devices and technologies are powered

Therefore, a powered technology is required for protection

To ensure our modern-day EMF devices and technologies
such as Wi-Fi, Mobile Phones etc. will still operate

Blushield technology uses a powered pure scalar wave technology for
EMF protection to be able to mitigate the damage to the brain and body
without interfering with the operation of EMF technologies...
